

Additional Thermodynamics Problems

$$\textcircled{1} \Delta S_{\text{univ}} = \Delta S_{\text{sys}} + \Delta S_{\text{surr}}$$

For a spontaneous process, $\Delta S_{\text{univ}} > 0$. If $\Delta S_{\text{sys}} < 0$, ΔS_{surr} is positive and greater than the magnitude of the decrease in ΔS_{sys} .

$$\textcircled{2} \text{ (a) } \Delta S \text{ (-)}$$

$$\text{ (c) } \Delta S \text{ (-)}$$

$$\text{ (b) } \Delta S \text{ (+)}$$

$$\text{ (d) } \Delta S \text{ (+)}$$

$$\textcircled{3} \text{ (a) } \text{CuO(s)} : 42.59 \frac{\text{J}}{\text{mol} \cdot \text{K}}$$

$$\text{Cu}_2\text{O(s)} : 92.36 \frac{\text{J}}{\text{mol} \cdot \text{K}}$$

Substances in the solid state have only vibrational motion available to them. The more complex Cu_2O has more vibrational degrees of freedom and a larger standard entropy.

$$\text{ (b) } 1 \text{ mol N}_2\text{O}_4\text{(g)} : 304.3 \text{ J/K}$$

$$2 \text{ mol NO}_2\text{(g)} : 2 \text{ mol} (240.45 \frac{\text{J}}{\text{mol} \cdot \text{K}}) = 480.90 \text{ J/K}$$

More particles have a greater number of arrangements.

$$\text{ (c) } \text{SiO}_2\text{(s)} : 41.84 \frac{\text{J}}{\text{mol} \cdot \text{K}}$$

$$\text{CO}_2\text{(g)} : 213.6 \frac{\text{J}}{\text{mol} \cdot \text{K}}$$

Molecules in the gas phase have a larger volume and more motional freedom than those in the solid state. SiO_2 is a covalent network solid so its molecular motion is even more restrained than typical molecular solid.

$$\text{ (d) } \text{CO(g)} : 197.9 \frac{\text{J}}{\text{mol} \cdot \text{K}}$$

$$\text{CO}_2\text{(g)} : 213.6 \frac{\text{J}}{\text{mol} \cdot \text{K}}$$

The more complex CO_2 molecule has more vibrational degrees of freedom and a slightly higher entropy.
